

The CADILLAC Trial¹

Baseline LVEF is the single most powerful predictor of mortality.¹

The CADILLAC risk score was developed to be a straightforward clinical scoring system for the prediction of short- and long-term mortality after primary PCI.

CADILLAC Patient Score	Risk Category
Score ≥ 6	High
Score 3–5	Intermediate
Score 0–2	Low

Risk Factor	Score
Baseline LVEF <40%	4
Renal insufficiency	3
Killip class II/III	3
Age >65 years	2
Final TIMI flow 0–2	2
Three-vessel disease	2
Anemia	2

- A patient with baseline LVEF <40% plus any other risk factor has a high short-term mortality.¹
- **60% of mortality is due to sudden cardiac death²**

Keyword: Post-PCI

Low EF and SCD Risk

Among these 3 studies, LVEF has been consistently shown to be a predictor of mortality in the short-term
